K, cirrus. KK, cirro-stratus. — C, cumulus. CC, cumulo-stratus. — A, nuages étalés (stratus) AA, alto-stratus.

Extrêmes du mois.

PRESSION BAROMÉTRIQUE...	Minimum..	$747^{mm},80$, le 1, à 5^h s.
	Maximum..	$765^{mm},23$, le 28, à 9^h m.
TEMPÉRATURE	Minimum..	7°,8 le 6.
	Maximum..	28°,0 le 30.
TENSION DE LA VAPEUR	Minimum.	$7^{mm},7$, le 5, à 8^h s.
	Maximum.	$17^{mm},0$, le 31, à 7^h s.
HUMIDITÉ RELATIVE.....	Minimum .	43, le 29, à 2^h s.
	Maximum..	100, six jours.

Journal météorologique.

Le 1er, très nuageux; pluie ou gouttes de 4^h à 9^h s.; halo. — Le 2, très nuageux; tonnerre au SW, puis au SE de $1^h 15^m$ à $1^h 30^m$. — Le 3, couvert toute la journée; pluie par intervalles. — Le 4, nuageux; tonnerre au NE à $1^h 30^m$ et à l'W à 4^h; halo. — Le 5, très nuageux; un peu de pluie l'après-midi. — Le 6, presque couvert; pluie ou gouttes de midi à 8^h s.; tilleuls en pleine fleur. — Le 7, couvert toute la journée; pluie par intervalles. — Le 8, très nuageux. — Le 9, très nuageux; tonnerre au NE, peu après; 1^h s. petites averses. — Le 10, nuageux.

Le 11, très nuageux; grande pluie de $7^h 10^m$ à $7^h 30^m$ m., pendant laquelle le vent saute de SW à WNW. — Le 12, couvert toute la journée; presque toujours des gouttes avant midi; pluie de $6^h 30$ à minuit. — Le 13, très nuageux; tonnerre dans l'ESE à $3^h 45^m$ et au SE à $6^h 30^m$ s.; souvent des averses. — Le 14, très nuageux; tonnerre au NW de $2^h 15^m$ à $2^h 45^m$ et au SW à $6^h 10^m$ s.; averses. — Le 15, très nuageux; à 2^h, tonnerre loin dans l'W; pluie de $7^h 30^m$ à $11^h 30^m$ m. — Le 16, très nuageux. — Le 17, très nuageux; coup de tonnerre au NE à $3^h 45^m$ s. — Le 18, très nuageux; vent variable; brouillard de 250^m à 6^h m. — Le 19, très nuageux; vent variable. — Le 20, très nuageux; pluie de 1^h à 7^h s. — Le 21, couvert toute la journée. — Le 22 couvert toute la journée; pluie de 7^h à 10^h m. et un peu le soir. — Le 23, très nuageux. — Le 24, très nuageux. — Le 25, nuageux; halo. — Le 26, très nuageux. — Le 27, nuageux. — Le 28, beau avec des cumulus. — Le 29, beau avec des cirrus. — Le 30, nuageux; halo. — Le 31, très nuageux.

La Marne a monté de $0^m,08$ le 13 à 2^m le 31. — Il est tombé $82^m,8$ d'eau en soixante-trois heures réparties en vingt et un jours. — On a remarqué sept jours de tonnerre et un jour de brouillard le 18. — Quatre jours ont présenté des halos.

Juillet 1879.

SAINTE-HONORINE-DU-FAY.

POUR LA FRANCE ET LES CONTRÉES VOISINES,

PENDANT L'ANNÉE 1879;

PAR M. ALFRED ANGOT.

I. — Introduction.

La Revue mensuelle de 1879 est rédigée suivant le même plan général que celle de l'année précédente; on a toutefois apporté quelques modifications dans le détail. La région comprise dans cette étude a été légèrement augmentée (1° en longitude vers l'Est, 1° en latitude vers le Sud); elle s'étend donc maintenant sur 28° de longitude (de 15° E. à 13° W. de Paris) et sur 25° de latitude (de 33° à 58° N.).

Les teintes hypsométriques de la Carte de fond sont toujours au nombre de cinq et sont limitées par les courbes de niveau de 150^m, 300^m, 600^m et 1200^m. Quelques incorrections qui avaient été découvertes dans le tracé de la Carte ont été modifiées.

Comme précédemment, on a donné pour chaque mois un Tableau numérique qui comprend, pour chaque station, l'ensemble des documents qui intéressent plus particulièrement la Climatologie : pression barométrique et température moyennes, températures extrêmes, pluie, etc. On a ajouté cette année l'humidité relative moyenne, qui ne figurait pas dans les Tableaux de 1878. Enfin, les Cartes de résumés donnent pour chaque mois : 1° la pression moyenne et le vent; 2° la température moyenne; 3° la distribution de la pluie.

La Carte des pressions est établie avec les moyennes vraies, réduites au niveau de la mer d'après les Tables spéciales qui ont été publiées dans les *Annales du Bureau central météorologique* pour 1878, t. I, p. C.13. Toutes ces pressions

sont, de plus, ramenées à la latitude 45°; cette dernière correction est loin d'être inutile, car sa valeur atteint $\pm 0^{mm},9$ environ aux limites nord et sud de la Carte.

La direction moyenne du vent a été calculée, comme on l'a expliqué dans la Revue précédente, au moyen de la formule de Lambert et en ne tenant compte que des directions. Il est incontestable que, dans un certain nombre de cas, les résultats ainsi obtenus n'ont pas une grande signification physique, mais les petites dimensions de la Carte empêchent tout autre mode de représentation. Du reste, on a apporté à cet élément, dans les Cartes de cette année, une modification notable, qui semble de nature à mieux préciser la valeur des résultats ainsi obtenus. On sait que la formule de Lambert conduit, pour l'angle α que fait la direction résultante du vent avec le méridien, à une expression de la forme

$$\operatorname{tang}\alpha = \frac{a}{b},$$

et que la longueur de cette résultante géométrique, exprimée au moyen des unités qui ont servi au dessin de la rose des vents, est

$$l = \sqrt{a^2 + b^2}.$$

Si, d'autre part, n est le nombre total d'observations du vent, calmes compris, la fraction $\frac{\sqrt{a^2 + b^2}}{n}$, toujours plus petite que l'unité, représente la grandeur relative de cette résultante, ce qu'on pourrait appeler sa *probabilité* ou plus exactement son *poids*. Si, pour une résultante déterminée, on trouve ainsi une probabilité ou un poids compris entre 0,7 et 1, cela signifiera que, pendant la période considérée, les vents se sont peu écartés de part et d'autre de leur résultante géométrique; celle-ci aura donc une valeur réelle et représentera bien un mouvement moyen de l'air dans cette direction. Si, au contraire, ce nombre est inférieur à 0,3, cela voudra dire soit que les vents ont soufflé à peu près également dans toutes les directions, soit que l'on a observé un grand nombre de calmes. Dans un cas comme dans l'autre, la résultante géométrique de la rose des vents ne représente plus un mouvement bien net de l'air dans sa direction.

On n'a pu faire entrer dans les Tableaux numériques, à côté de la direction du vent moyen, le poids ou la probabilité de cette direction, calculé comme il a été dit plus haut. Mais ce dernier élément a été indiqué sur les Cartes au moyen de pennes, à raison d'une penne pour chaque dixième de probabilité. Ainsi une flèche avec trois pennes représente une direction dont le poids ou la probabilité est 0,3, une flèche avec sept pennes possède une probabilité égale à 0, 7, et ainsi de suite.

En se reportant par exemple à la première Carte, celle de janvier 1879, on voit six pennes aux vents de Valentia, d'Armagh, de Livourne, de Biskra, etc., sept à ceux de Gênes, de Modène, de Pesaro, d'Alger. La résultante géométrique des directions du vent correspond donc certainement, pour ces régions, à un mouvement général de l'air qui s'est effectué dans cette direction moyenne. Au contraire, dans toute l'Europe centrale, en Bavière, en Suisse, les flèches du vent moyen ont un nombre de pennes inférieur à trois. La circulation atmosphérique, dans ces régions, n'a donc pas présenté de caractère net, de direction dominante. L'importance de cette addition paraît incontestable, et la valeur des Cartes moyennes de pression et de vent en est certainement beaucoup augmentée.

Les Cartes de température sont tracées avec les moyennes vraies, réduites au niveau de la mer. Pour cette réduction, on a admis que la température décroît proportionnellement à l'altitude et à raison de 1° pour 180^{m} dans les saisons moyennes, pour 200^{m} en hiver (décembre, janvier, février) et pour 160^{m} en été (juin, juillet, août). Tels sont, en effet, les nombres moyens les plus vraisemblables; du reste, une petite variation dans ces nombres n'amènerait dans le tracé des isothermes que des différences insignifiantes. La décroissance de 1° pour 160^{m} est peut-être un peu faible en été pour des pays à climat très sec, comme l'Espagne et l'Algérie; mais, comme dans ces pays, par suite de l'insolation, les températures observées sont généralement trop hautes, il est probable que les Cartes construites avec les hypothèses rappelées plus haut s'écartent peu de la vérité.

La pluie est figurée sur les Cartes par quatre teintes, séparées par les lignes qui correspondent aux hauteurs de pluie de 50^{mm}, 100^{mm}, 150^{mm} et 200^{mm}. De plus, la courbe de 25^{mm} est indiquée; mais on a supprimé, pour la clarté, les courbes de 75^{mm}, 125^{mm}, etc., bien que ces dernières aient été tracées sur les minutes. Le nombre des stations qui ont servi à établir les Cartes de pluie est considérable (plusieurs milliers); aussi les Cartes ont toujours été dessinées à grande échelle pour chaque pays séparément, et ce sont ces grandes Cartes, réunies et réduites, qui ont permis de tracer avec une grande exactitude celles qui figurent dans cette Revue.

Enfin l'on a ajouté, comme l'année précédente, quatre Cartes de résumés annuels : pression barométrique, température, hauteur de pluie et nombre de jours de pluie. Le tracé de cette dernière Carte présente de grandes difficultés, car l'évaluation du nombre des jours de pluie est faite de diverses manières, suivant les observateurs, et l'on peut relever aisément, dans bien des cas, des omissions évidentes. Toutefois, comme le nombre des stations est grand, on peut affirmer que la Carte est exacte, au moins dans ses traits généraux.

II. — Discussion des observations.

1° *France.* — Les données qui ont été utilisées pour la France en 1879 ont été fournies par 6 Observatoires, 52 Écoles normales et 12 stations diverses. Dans le plus grand nombre de ces stations, le nombre des observations quotidiennes est égal ou supérieur à 6, et dans aucune il n'est inférieur à 3. Comme toutes ces observations sont publiées dans la première Partie de ce Volume, soit intégralement, soit en résumés mensuels, on n'a fait figurer dans les Tableaux que les stations principales, celles qui permettent le mieux de caractériser les différents régimes que l'on rencontre en France.

Les Cartes de pluie sont établies avec les données recueillies dans 1100 stations environ.

Nous ne reproduisons ici ni le Tableau de la position des stations ni l'exposé des moyens employés pour calculer les moyennes vraies. On trouvera ces documents, pour la France et les autres contrées, dans la Revue de 1878.

2° *Algérie.* — Nous avons pu disposer, pour le tracé des Cartes, des observations effectuées dans 35 stations du Service météorologique de l'Algérie, auxquelles ont été jointes les observations complètes de Mogador (Maroc) et les observations pluviométriques de Tunis et Sfax (Tunisie).

Toutefois, un certain nombre de ces stations ont dû être négligées pour les Cartes de pression, soit parce qu'on n'y possède que des baromètres anéroïdes, soit parce que l'altitude est imparfaitement connue. Enfin on peut remarquer quelques anomalies dans les observations : ainsi la température de Tlemcen semble bien élevée, si on la compare à celle de Sidi-bel-Abbès; la pression, réduite au niveau de la mer, est généralement un peu basse à Orléansville ($0^{mm},6$ ou $0^{mm},8$), et au contraire un peu haute à La Calle, etc.

3° *Espagne.* — Les nombres publiés pour l'Espagne proviennent de résumés mensuels manuscrits qui ont été gracieusement mis à notre disposition par MM. Aguilar et Pujazon, et qui comprennent 9 stations pour l'ensemble des éléments météorologiques et 26 pour la pluie.

Les températures paraissent généralement un peu élevées, surtout en été, ce qui tient probablement au mode d'installation des thermomètres, dont les moindres défauts prennent une importance particulière dans un pays de forte insolation comme est l'Espagne. L'excès de température est surtout appréciable à Bilbao, où il atteint au moins 1° pour la moyenne annuelle.

Quant aux baromètres, nous signalerons, comme en 1878, celui de Burgos, qui, réduit au niveau de la mer, donne une pression trop faible de $0^{mm},9$ environ, par suite d'une connaissance incertaine de l'altitude ou de la correction

fixe de l'instrument. Au contraire, le baromètre de Bilbao semble un peu élevé ($0^{mm},2$ environ).

4° *Portugal.* — Comme en 1878, nous avons utilisé, pour le Portugal, les observations de Lisbonne, Campo-Maïor, Coïmbre et Porto. La pression barométrique, réduite au niveau de la mer, paraît trop faible d'environ $0^{mm},8$ à Campo-Maïor et de $0^{mm},6$ à Porto. Nous avons signalé du reste ces anomalies dans la Revue de 1878.

5° *Italie.* — Les stations italiennes dont les observations ont été utilisées sont les 24 stations de la *Meteorologia italiana*. On y a de plus ajouté, pour la confection des Cartes de pluie, les 94 stations du réseau de l'Association alpine-apennine, publiées dans le *Bullettino meteorologico dell' Osservatorio del Coll. R. Carlo-Alberto in Moncalieri.*

Les températures observées en Italie sont quelquefois un peu élevées, surtout pendant les mois d'été. Quant aux baromètres, ils sont généralement très concordants, excepté toutefois celui de Foggia : les pressions réduites au niveau de la mer pour cette station paraissent constamment trop faibles de $0^{mm},5$ ou $0^{mm},6$.

6° *Suisse.* — Nous avons utilisé, pour la Suisse, 12 des 15 stations dont les observations sont publiées régulièrement dans les *Schweizerische meteorologische Beobachtungen;* les 3 autres ont été négligées, comme étant à une altitude qui dépasse 1500^{m}. Les hauteurs barométriques et les températures de ces stations paraissent bien concordantes.

7° *Autriche.* — Pour la portion de l'empire d'Autriche comprise dans nos Cartes, nous avons disposé plus spécialement des observations de Vienne, de Prague et de Pola. Nous devons de plus à l'obligeance de M. le Dr Hann des résumés mensuels de température et de hauteurs de pluie pour un certain nombre de stations. Enfin, on a introduit dans la construction des Cartes de pluie les données recueillies par le réseau des stations ombrométriques de la Bohême.

8° *Bavière.* — Le Service météorologique du royaume de Bavière a publié, pour l'année 1879, les observations intégrales recueillies dans 14 stations principales. Toutes ces données ont été employées dans la construction des Cartes mensuelles, et pour la pluie on y a ajouté les observations de 18 stations secondaires. Il n'y a aucune remarque à faire sur ces observations, qui présentent, surtout pour le baromètre, une concordance remarquable.

9° *Belgique et Hollande.* — Les documents relatifs à la Belgique ont été empruntés aux résumés climatologiques mensuels publiés par l'Observatoire de Bruxelles; pour la Hollande, on a utilisé les données contenues dans le *Nederlandsch meteorologisch Jaarboek voor* 1879. Comme nous l'avons déjà fait remarquer dans la Revue de l'année précédente, les températures sont généralement

un peu élevées dans ces deux pays. Ainsi, tandis que la température moyenne de l'année n'est que 8°,4 à Paris, Bruxelles donne encore 8°,3 et Utrecht 7°,7.

10° *Iles Britanniques.* — Les documents utilisés pour les îles Britanniques sont très nombreux; ce sont : 1° les observations horaires des 7 Observatoires du *Meteorological Office;* 2° les résumés mensuels publiés pour 24 stations par la Société météorologique d'Angleterre; 3° les résumés mensuels publiés pour 55 stations d'Écosse par M. Piazzi Smyth; 4° enfin, pour la pluie, toutes les données précédentes, et de plus les observations recueillies dans le *Monthly meteorological Magazine* et dans *British Rainfall for* 1879 que publie M. G. Symons, ce qui fait un total de stations pluviométriques supérieur à 300.

11° *Allemagne.* — Les documents pour l'Allemagne n'ont pu être empruntés, pour l'année 1879, à la Revue mensuelle du temps publiée par la *Deutsche Seewarte,* Revue qui ne nous est encore parvenue que pour les quatre premiers mois de l'année. On a eu recours aux résumés mensuels publiés pour 126 stations dans la *Preussische Statistik.*

Comme nous l'avons fait remarquer l'année précédente, un certain nombre de stations présentent des anomalies qui rendent difficile l'utilisation de tous ces documents. Par exemple, la pression barométrique réduite au niveau de la mer est certainement trop faible dans les stations de Lauenburg (Pommern), Köslin, Fulda, etc., et surtout Kalau, trop élevée dans celles de Marburg, Cologne, Hanovre, etc., et surtout Halle. Il est probable que les altitudes de quelques-unes de ces stations devraient être modifiées.

Quant aux températures, le plus grand nombre est certainement beaucoup trop élevé. Ainsi Berlin donne une moyenne annuelle (réduite) de 8°,5, tandis que Frankfort-sur-Oder donne seulement 7°,3; il est permis d'estimer au moins à 1°,5 l'excès de la température moyenne annuelle de Berlin. Un excès égal pourrait encore être signalé par exemple à Cologne, et dans beaucoup d'autres stations on trouverait des moyennes annuelles certainement trop élevées de 1°. Il a donc été indispensable de négliger, pour le tracé des courbes, un certain nombre de données.

12° *Danemark et Suède.* — Tous les documents nécessaires pour le Danemark ont été empruntés aux Revues mensuelles autographiées que publie l'Institut météorologique de Copenhague.

Pour la petite partie de la Suède comprise dans nos Cartes, le *Bulletin du Nord* nous a fourni les observations quotidiennes de 2 stations, Göteborg et Carlshamn. Enfin nous avons utilisé encore les observations horaires de l'Observatoire d'Upsal, bien que cette station tombe en dehors de la Carte.

III. — Revue mensuelle.

Janvier.

En janvier 1879, la distribution moyenne de la pression sur l'Europe occidentale montre deux maxima au Nord-Est et au Sud-Ouest, et deux minima, l'un au Nord-Ouest, sur l'Océan, l'autre au Sud-Est sur la Méditerranée. Le maximum du Sud-Ouest, qui se prolonge sur l'Espagne et l'Algérie, et le très faible minimum relatif de la Méditerranée (entre 760^{mm} et 761^{mm}) ont, à très peu de chose près, leur disposition et leur valeur ordinaires. Il en est tout autrement du maximum du Nord-Est, qui amène, en Danemark et dans le sud de la Suède, une pression moyenne en excès de 7^{mm} à 8^{mm} sur la pression normale de janvier.

Ce maximum se manisfeste comme une extension vers l'ouest du maximum normal de la Sibérie. A partir du 8, en effet, les hautes pressions s'établissent sur la Suède et surtout sur la Russie. Malgré les faibles pressions du commencement du mois, la pression moyenne atteint, pour janvier, 769^{mm} à Saint-Pétersbourg et 774^{mm} à Moscou; dans cette dernière ville, le baromètre s'est tenu pendant neuf jours consécutifs, du 22 au 30, au-dessus de 780^{mm}, et pendant quatre jours il a dépassé 785^{mm}.

Sous l'influence de cette zone de hautes pressions, le régime des vents d'entre Nord et Est est général, au nord du 46e degré de latitude, dans la région que nous considérons et y amène une température moyenne inférieure à la normale. En Angleterre, principalement, le froid est tout à fait exceptionnel, car, dans presque tout le pays, la température moyenne est inférieure à zéro, et l'on remarque même au Centre une région, comprise entre Sheffield, Leicester et Worcester, où la température moyenne du mois tombe au-dessous de $-1°$. Dans un grand nombre de stations, le minimum absolu a dépassé $-13°$, et, dans quelques-unes, on signale même des minima de $-17°$ et $-18°$.

En France, la température, bien qu'inférieure à la normale dans le Nord et l'Est, a été moins basse qu'en Angleterre. Dans aucun point la moyenne réduite au niveau de la mer n'a atteint $-1°$, et les minima absolus sont à peine de $-10°$, excepté dans l'Est, où ils arrivent à $-14°$ ou $-15°$.

Grâce à la prédominance des vents d'Est, ce mois a été généralement assez sec sur toute l'Europe occidentale, et ce n'est que le long des côtes de l'Océan que l'on rencontre des zones de quelque étendue où la hauteur de pluie recueillie dépasse 100^{mm}.

En France, les variations du baromètre ont été assez grandes, mais non exceptionnelles : les pressions extrêmes observées à Paris correspondent, en effet, à $745^{mm},2$ et $773^{mm},4$, soit une amplitude totale de $28^{mm},2$. Quelques dépressions

ont traversé notre pays, généralement du Nord-Ouest au Sud-Est, et notamment les 4, 8 et 16. La bourrasque principale est celle du 8, qui a passé en ligne droite du golfe de Gascogne à la Méditerranée, amenant à Paris, le 8 à 2^h du soir, le minimum de $745^{mm},2$ signalé plus haut. Cette bourrasque a été accompagnée sur son parcours de pluies très abondantes : 64^{mm} à la Roche-sur-Yon, 69^{mm} à Limoges, 51^{mm} à Toulouse, 111^{mm} à Saint-Martin-de-Hinx, 99^{mm} à Montpellier. La trace de ces pluies se retrouve aisément sur la Carte du mois (*voir* Carte **25**), dans le maximum de pluie qui s'étend en bande de l'embouchure de la Loire au département de l'Hérault. Dans ce dernier département, des chutes très abondantes de pluie se sont encore produites du 24 au 28, sous l'influence d'un régime persistant de vents d'Est, qui amenaient sur les Cévennes l'air chaud et humide de la Méditerranée. C'est à ces deux influences distinctes que l'on doit attribuer ce fait anomal que le maximum de pluie du mois, pour toute l'Europe occidentale, se présente dans le département de l'Hérault et sur les Cévennes. Il y a là, en effet, toute une région où la hauteur de pluie, supérieure à 200^{mm}, atteint par endroits 300^{mm} et même 400^{mm}.

Février.

En général, la situation atmosphérique a été très troublée dans l'Europe occidentale pendant tout le mois de février, et des dépressions nombreuses et d'une importance exceptionnelle ont abaissé la pression moyenne bien en dessous de la valeur normale, excepté en Espagne et dans l'Algérie occidentale, qui sont restées à peu près en dehors de ces mouvements.

En raison même du nombre des perturbations, il est impossible de donner une idée des caractères que le mois de février a présentés sans entrer dans le détail.

Une aire de basses pressions, qui se montrait le 1^{er} et le 2 à l'ouest des îles Britanniques, s'avance vers l'Est le 4 et disparaît le 5 sur l'Allemagne; sous son influence, le baromètre tombe à $749^{mm},9$ à Paris le 3 à 5^h du soir. Le 5, une nouvelle aire de basses pressions se montre de l'ouest de la Norvège au nord-ouest de l'Écosse; elle persiste les jours suivants en s'accentuant (Thurso, 733^{mm}), descend un peu le 9 et le 10 et commence alors seulement à marcher vers l'Est; à son approche, le baromètre descend à $740^{mm},7$ à Paris le 10 à 2^h du soir, puis elle continue son mouvement et disparaît le 13 vers la Russie. Les basses pressions reparaissent le même jour à l'ouest de l'Irlande et persistent sur les îles Britanniques jusqu'au 22. Ces basses pressions permanentes sont en même temps accompagnées sur leur bord méridional de bourrasques qui circulent de l'Ouest à l'Est, et parmi lesquelles deux surtout sont dignes de remarque. Une première fait descendre le baromètre à $738^{mm},5$ à Paris le 17 à 9^h

du matin, amenant de forts vents sur la Manche et des manifestations orageuses dans les Vosges. La seconde est plus remarquable encore : par la surface relativement petite qu'elle occupe, la valeur de la dépression centrale, sa vitesse et la violence des vents qui l'accompagnent, elle offre presque, en effet, les allures d'un cyclone des régions tropicales (1). Le 20 à 9^h du matin, le centre (732^{mm}) se trouve à l'ouest de l'île de Ré, sur le méridien de l'île d'Yeu; de ce centre à l'île d'Oléron, pour une distance de 80^{km}, la variation de pression dépasse 10^{mm}. En douze heures, l'ouragan traverse la France sur la ligne Poitiers, Bourges, Dijon et Bâle, produisant dans tout le Centre des dégâts considérables et de grandes chutes de pluie ou de neige.

Le 23, le régime change complètement : des pressions relativement élevées s'établissent dans le nord de l'Europe, et une baisse considérable se produit dans le golfe de Gênes (Monaco, 733^{mm}). Cette dépression amène de fortes pluies dans le golfe de Gênes (Gênes, 38^{mm}; Porto-Maurizio, 44^{mm}; Nice, 49^{mm}), puis elle remonte le 24 et le 25 jusqu'en Russie; mais, en même temps, une autre lui succède et avec des caractères plus exceptionnels encore que celle du 20. En effet, profonde et peu étendue comme cette dernière, elle provient d'un endroit d'où il est extrêmement rare de voir des bourrasques se propager vers l'Europe. Le 24 à 1^h du soir, le baromètre marque seulement $741^{mm},8$ à Biskra (Algérie), et une dépression bien nette existe autour de ce point. Elle marche vers le Nord-Est en se creusant dès qu'elle arrive sur la Méditerranée, vers 9^h du soir, et remonte vers le Nord, entre la Sardaigne et l'Italie. Le centre arrive vers minuit, dans la nuit du 24 au 25, à la hauteur de Cagliari; on le retrouve le 25, à 9^h du matin, près de Livourne (734^{mm}), le 26 en Allemagne et le 27 en Russie.

Enfin, le 27 et le 28, les basses pressions s'établissent de nouveau à l'ouest de la Norvège.

C'est aux deux dépressions du 23 et du 25 qu'il faut attribuer le minimum fermé que la Carte moyenne du mois (Carte 2) montre sur le golfe de Gênes.

Les vents dominants soufflent en général de l'Ouest, et, comme on le voit par le nombre de pennes que portent les flèches, le régime est très net sur l'Espagne et l'Algérie, que n'ont presque jamais atteintes les perturbations. En France et en Angleterre, le régime est moins net, mais les vents soufflent encore en général d'entre Ouest et Sud avec température moyenne à peu près normale. Au contraire, en Danemark, en Suède et en Norvège, les basses pressions qui ont régné si fréquemment sur l'Océan pendant ce mois ont déterminé une grande prédominance des vents d'Est; aussi la température est-elle relativement très basse. Dans tous ces pays et dans l'Allemagne du Nord, la moyenne du mois est infé-

(1) *Annales du Bureau central météorologique*, 1878, t. I; *Étude de l'ouragan du 20 février*, par M. Rollin.

rieure à 0°; elle est en défaut de près de 2° en Hollande et en Allemagne, et de plus de 3° en Danemark et dans le sud de la Suède.

Quant à la distribution de la pluie, la trajectoire des bourrasques, la direction des vents dominants par rapport aux terres et aux mers et les reliefs du sol suffisent pour rendre compte de toutes les particularités. La pluie a été surtout abondante dans le golfe de Gascogne et à la pointe occidentale de l'Espagne, comme cela est normal en hiver par un régime de vents d'Ouest.

Si l'on compare aux Cartes de février 1879 celles qui ont été données l'année précédente pour le mois correspondant de 1878, on ne peut qu'être frappé du contraste que ces deux mois présentent : l'un avec une pression généralement basse, de la pluie, des bourrasques nombreuses et importantes; l'autre avec de très hautes pressions, une grande sécheresse, du beau temps et l'absence absolue de dépressions dans toute la région qui environne la France. Il est intéressant de retrouver ainsi, seulement à un an d'intervalle, les deux caractères les plus différents que puisse présenter un même mois.

Mars.

Le mois de mars présente des caractères absolument opposés à ceux de février.

Pendant la première quinzaine, le baromètre reste élevé à l'Ouest, soit en Espagne, soit en France, soit sur l'Allemagne centrale. Aucune bourrasque ne se montre dans cette région, et le temps est calme, beau et sec par toute la France.

Le 16, le régime change : des pressions relativement basses s'établissent à l'Ouest, tandis que, depuis le 20 jusqu'à la fin du mois, le baromètre reste élevé dans le Nord-Est, en Russie et en Suède, où il atteint fréquemment 775^{mm}. Du 16 au 28, les basses pressions se trouvent surtout à l'ouest du golfe de Gascogne, tandis qu'à partir du 28 elles se creusent un peu (de 740^{mm} à 745^{mm}) et remontent au nord-est de l'Écosse. La seule dépression un peu importante qui atteigne nos parages se montre le 19 au large de l'Espagne; elle s'avance lentement vers l'Est les jours suivants, semble se séparer le 22 des deux côtés des Pyrénées en deux dépressions qui se réunissent de nouveau le 23 sur la Méditerranée, entre l'Espagne et la Corse, puis continuent leur route vers l'Est en traversant l'Italie le 24 et le 25. Une autre dépression aborde les côtes de Bretagne le 27 (Brest, 744^{mm}), mais se comble peu après le 28 sans dépasser notablement le méridien de Paris. Aucune de ces dépressions n'amène, du reste, de vents violents ni de pluies abondantes. En France, les pluies ne sont notables pendant tout le mois que dans la région des Cévennes, où la hauteur d'eau recueillie dépasse parfois 200^{mm}. Ces pluies sont tombées presque exclusivement du 18 au 24, sous l'influence de la dépression que nous avons signalée plus haut.

En général, la température moyenne est à peu près normale dans toute la

moitié sud de la Carte et en Angleterre; elle est légèrement en défaut dans le Nord et l'Est, en Allemagne, en Danemark et en Suède, où l'on remarque encore quelques régions dont la température moyenne est inférieure à zéro. A Paris, le minimum absolu n'est que — 3°,1 et il n'y a eu que 4 jours de gelée.

Avril.

La distribution des pressions en avril présente cette particularité curieuse d'une bande de faibles pressions qui s'étend sur le sud des îles Britanniques, le nord de la France, l'Allemagne centrale, le golfe de Gênes et l'Autriche. Des deux côtés de cette bande, la pression va en augmentant, faiblement vers le Nord, beaucoup plus rapidement vers le Sud, et surtout le Sud-Ouest, sous l'influence du maximum de l'Atlantique, qui est bien développé (765^{mm}, Madère; 766^{mm}, les Açores). Une disposition analogue se retrouvait déjà dans la Carte d'avril de l'année précédente. Aussi le régime des vents est-il à peu près le même pour les deux années : vents d'Est à Nord au-dessus du 52^{e} degré de latitude, et de la région Ouest sur le golfe de Gascogne, l'Espagne, l'Algérie, la Méditerranée et l'Italie.

Cette distribution anomale des pressions tient à ce qu'aucune des nombreuses bourrasques de ce mois n'a affecté directement la mer du Nord ni les côtes de Norvège, où les Cartes quotidiennes indiquent même fréquemment un maximum de pression. Presque toutes les bourrasques sont venues de l'Océan et ont alors abordé l'Europe par la France ou bien ont pris naissance sur la Méditerranée; puis elles remontaient soit vers la Baltique, en traversant l'Europe centrale, soit plus à l'Est, vers la Russie, en passant par la Hongrie, après s'être infléchies d'abord vers le sud de l'Italie en quittant le golfe de Gênes. Parmi ces bourrasques, celles qui ont affecté plus spécialement la France sont : dans le Nord, celles du 7 au 8 (minimum à Paris, 739^{mm},7 le 7 à 3^{h} du soir), du 15 au 17 (minimum à Paris, 749^{mm},4 le 15 à 6^{h} du soir), et du 21 (minimum à Paris, 742^{mm},6 le 21 à 7^{h} du matin); dans le Sud, et plus particulièrement le golfe du Lion, celles du 2 au 4, des 11-12, du 15 et du 28.

Sous l'influence de ces bourrasques nombreuses, les pluies ont été fréquentes partout en France, surtout dans le Centre et le Sud-Ouest, qui ont ressenti les effets aussi bien des bourrasques du Nord que de celles du Sud. On relève en effet 22 jours de pluie à Paris, 24 à Lyon et à Toulouse, 29 à Saint-Martin-de-Hinx (Landes). Les orages ont été également fréquents : 5 à Paris, 6 à Saint-Martin-de-Hinx, etc.

La température est généralement basse sur toute l'étendue de la Carte (Carte n° 16), et la comparaison de cette dernière avec la Carte correspondante de 1878 présente quelque intérêt. En 1878, la saison chaude avait été hâtive : le régime d'été se montre nettement en Algérie dès le mois de mars, et il commence déjà

à se faire sentir dans le sud de l'Espagne, pour s'établir dans tout le reste du pays le mois suivant. En avril 1878, en effet, l'Algérie et l'Espagne présentent partout une température moyenne notablement supérieure à celle des mers voisines. En 1879, rien de pareil ne se produit : non seulement la Carte de mars montre que l'Espagne et l'Algérie sont encore dans le régime d'hiver avec des pluies et une température plus basse, à latitude égale, que celle de la mer, mais ce régime persiste en avril, non seulement en Espagne, mais encore en Algérie, dans le Tell et sur les hauts plateaux. C'est seulement dans le Sahara que les caractères de l'été, avec redressement des isothermes vers le Nord, commencent à apparaître. Aussi la saison pluvieuse s'est-elle prolongée en Algérie plus longtemps que de coutume. Tandis qu'en avril 1878 la pluie totale du mois est partout inférieure à 25^{mm}, et même tout à fait insignifiante dans un grand nombre de stations, en avril 1879, au contraire, la quantité de pluie recueillie est presque partout, sauf dans les régions sahariennes, supérieure à 50^{mm} et dépasse même 100^{mm} dans une portion notable du pays.

Mai.

En mai, la Carte des pressions moyennes offre dans tout l'Ouest le caractère d'un mois d'été, c'est-à-dire la présence au large de nos côtes d'un grand maximum de pression. Le maximum de l'Atlantique est en effet très bien marqué (environ 769^{mm} aux Açores), et il s'étend même vers le Nord beaucoup plus que de coutume. Cette extension sur la Carte moyenne s'explique aisément au moyen des Cartes quotidiennes. On remarque en effet que le maximum des Açores a éprouvé, pendant le mois, de nombreux déplacements. Du 1er au 10, il est beaucoup au nord de sa position normale, et le centre, où la pression dépasse fréquemment 770^{mm}, oscille entre les latitudes de 40° à 60°; du 10 au 13, il redescend, pour remonter le 15 et le 16, et osciller encore jusque dans les derniers jours du mois, où il reprend sa position normale.

Les minima relatifs de pression sur l'Espagne et l'Algérie appartiennent aussi au régime d'été et sont, comme nous le verrons plus loin, en relation avec des maxima correspondants de température.

Jusqu'au 10, les hautes pressions de l'Atlantique protègent les îles Britanniques et la France contre les bourrasques de l'Ouest. Aussi ne voit-on se propager de dépressions que soit du côté de la Scandinavie et de la Russie, et en ce cas elles ne font pas sentir leur influence dans l'ouest de l'Europe, soit sur la Méditerranée. De ce côté il y en a surtout deux à signaler : une qui se forme le 2 sur le golfe du Lion, l'autre qui se présente le 7 au large du Portugal, arrive sur la Méditerranée le 8 et continue lentement sa route vers l'Est.

Le 14, au contraire, une dépression se présente sur l'Angleterre, suivie le 17

par une seconde ; toutes deux se déplacent vers l'Est et, quoique peu importantes au point de vue de la baisse du baromètre, amènent cependant des pluies notables dans le nord et le centre de la France. Enfin, dans les derniers jours du mois, deux dépressions, venues l'une d'Algérie le 25, l'autre de l'Océan par l'Irlande le 26, se réunissent le 27 sur la France, s'y maintiennent deux jours et disparaissent ensuite le 31 vers la Scandinavie, après avoir toutefois amené dans notre pays des pluies générales.

Comme on le voit sur la Carte, la direction des vents dominants est très régulière et en parfait accord avec la répartition de la pression. Les vents dominants sont du Nord-Ouest sur les îles Britanniques et la France, inclinant au Nord sur l'Espagne et le Portugal ; le nombre de pennes des flèches montre de plus que ces directions ont une grande probabilité, que le vent s'est écarté très peu pendant tout le mois de sa direction moyenne.

Par suite de ce régime constant de vents du Nord, la température est restée beaucoup en dessous de la moyenne dans les îles Britanniques, en France, en Espagne et même en Algérie. Dans ce pays, le régime d'été est enfin complètement établi, mais avec un retard de deux mois sur l'année précédente. En Espagne, le même régime commence seulement à se manifester dans le Sud, avec un retard analogue. En Allemagne, la température est aussi inférieure à la moyenne, mais beaucoup moins qu'en France, l'Allemagne ayant été moins exposée aux vents de Nord-Ouest et s'étant trouvée davantage sur le passage des bourrasques. Ces circonstances rendent compte du redressement rapide des isothermes vers le Nord, qui se manifeste à l'est du méridien de Paris.

Quant à la distribution de la pluie, les particularités que présente la Carte s'expliquent aisément par les considérations qui précèdent. La pluie est généralement faible dans l'ouest et le nord de l'Europe, où le temps a été peu troublé. Au contraire, en Italie, et surtout dans le fond du golfe de Gênes et sur le versant méridional des Alpes, la pluie a été considérable et dépasse 400^{mm} dans un grand nombre de stations. Elle a été amenée par le passage des trois bourrasques méditerranéennes du 2, du 7 et du 25, signalées plus haut, la dernière surtout, qui a donné à elle seule, dans un certain nombre de stations, plus de 200^{mm} de pluie (106^{mm} à Cuneo dans la seule journée du 26).

Juin.

Le régime d'été se montre, pendant le mois de juin, sur toute l'Europe occidentale. A latitude égale, les continents présentent un notable excès de température par rapport aux mers, et les maxima d'Algérie, d'Espagne et d'Italie sont surtout développés, plus même qu'ils ne l'étaient l'année précédente. Dans le nord de la Carte, sur les îles Britanniques, le régime d'été est encore nettement indiqué, bien que la température soit beaucoup inférieure à la normale,

principalement sur l'Angleterre proprement dite. On ne peut guère citer, dans les trente ou quarante dernières années, que le mois de juin 1860 qui ait donné, pour ce pays, une aussi basse température et une aussi grande quantité de pluie.

Ces caractères exceptionnels tiennent à de nombreuses dépressions barométriques qui ont traversé pendant ce mois le sud de l'Angleterre, y faisant fréquemment tomber le baromètre en dessous de 750^{mm}. La Carte des pressions moyennes (Carte n° 6) montre la trace de ces dépressions par la direction Sud-Ouest Nord-Est des isobares sur l'Europe occidentale, tandis que la direction normale est plutôt Est-Ouest, ainsi que par la faible valeur de la pression moyenne (de 758^{mm} à 755^{mm}) sur les îles Britanniques.

Bien que la France ne se soit pas trouvée directement sur le trajet de ces dépressions, elle n'en a pas moins ressenti leur influence, principalement sur les versants de l'Océan et de la Manche. Les orages ont été nombreux et les pluies fréquentes, plutôt qu'abondantes. On relève, par exemple, 20 jours de pluie à Paris, 22 à Arras, Beauvais, Le Mans, 23 à Chartres, Laval, Sainte-Honorine-du-Fay, 26 à Alençon, 28 à la pointe de Bretagne. Dans le Sud, au contraire, sur le versant méditerranéen, les variations barométriques sont faibles, le temps généralement beau et la pluie à peu près insignifiante. Elle serait même presque nulle, sans les orages du 16. Le nombre de jours de pluie, qui tombe déjà à 17 à Lyon, n'est plus, en effet, que de 9 à Carcassonne, 7 à Marseille, 5 à Montpellier et Perpignan, 3 à Aix et Gap, et 2 enfin à Avignon, Draguignan et Nice. Les mêmes conditions sont encore plus accentuées en Espagne, en Italie et en Algérie, où la quantité de pluie est inférieure partout à 25^{mm}. Dans toute l'Italie méridionale, la Sicile et la plus grande partie de l'Algérie, on ne signale même aucune pluie pour tout le mois.

Juillet.

Comme le mois précédent, juillet se présente avec des caractères tout à fait normaux dans le sud-ouest de l'Europe, mais exceptionnels au nord du parallèle de 46°. Le maximum des Açores, très bien développé (plus de 769^{mm} aux Açores mêmes), se prolonge comme d'ordinaire sur le golfe de Gascogne et la France centrale, jusqu'en Suisse et la Méditerranée, entamé par les deux minima de la vallée du Pô et surtout de l'Espagne, minima qui sont corrélatifs à des maxima de température. Dans toute la moitié inférieure de la Carte (Carte n° 7), la distribution des pressions reproduit donc presque identiquement la Carte normale, non seulement pour la direction générale des isobares, mais encore pour la valeur absolue de la pression.

Au nord du 46^{e} degré, au contraire, l'anomalie est grande; les isobares, dirigées à peu près Est-Ouest, comme d'ordinaire, sont beaucoup plus resserrées que de coutume, de telle sorte que la pression, normale encore à Saint-

Martin-de-Hinx, Toulouse et Marseille, est déjà en défaut de plus de 3^{mm} à la latitude de Paris et de 5^{mm} dans le sud des îles Britanniques. Ces différences ont été amenées par le passage de nombreuses et profondes dépressions qui se sont succédé pendant presque tout le mois, marchant à peu près de l'Ouest à l'Est sur le parallèle de 55°, et amenant sur les îles Britanniques et la Baltique des pressions fréquemment inférieures à 745^{mm}, et quelquefois même à 740^{mm}.

Sous l'influence de ces dépressions, le temps a été en général mauvais dans toute la France, la région méditerranéenne exceptée. Il a plu, en effet, presque tous les jours jusqu'au 24, et le nombre de jours de pluie s'élève à 21 pour Paris, Chartres et Le Mans, à 22 pour Alençon et Arras, à 23 pour Commercy et Épinal, à 24 pour Nancy, Rouen et Sainte-Honorine-du-Fay, à 25 enfin pour Lons-le-Saulnier, Laon et Brest, chiffres considérables pour la saison. Dans un grand nombre de stations, la pluie recueillie donne le plus fort total des douze mois de l'année.

Les pluies sont de même très abondantes dans les îles Britanniques et l'Europe centrale, surtout dans la région du Jura et la Suisse, les Alpes du Tyrol et de l'Autriche. Dans le sud de l'Europe, au contraire, le régime normal de l'été est accompagné des sécheresses habituelles. On ne signale même aucune pluie dans la plus grande partie de l'Italie, de l'Espagne et de l'Algérie.

Au point de vue de la température, il ne reste presque plus rien à signaler qui ne soit implicitement contenu dans les considérations qui précèdent. Le thermomètre est bien au-dessous de la moyenne dans les îles Britanniques, de même qu'en Danemark, en Allemagne, dans les Pays-Bas et le nord de la France. Au contraire, la température est normale en Espagne et en Algérie. Dans tout le Nord, les maxima absolus sont également peu élevés : ainsi le maximum absolu n'est que de 28° à Paris, et il n'atteint 30° dans aucune station du bassin de la Seine ou de la rive droite de la Loire.

Août.

Le régime des deux mois précédents continue dans le nord de l'Europe, et de nombreuses dépressions traversent les îles Britanniques et la mer du Nord. Il faut citer surtout pour son importance celle du 27 au 29, qui fit tomber le baromètre en dessous de 733^{mm} en Écosse, dans la nuit du 28 au 29. Aussi les pluies sont-elles fréquentes et abondantes sur les îles Britanniques, les côtes de la mer du Nord et le Danemark, avec température inférieure à la normale, par suite de la persistance du temps couvert.

En dessous du 46^{e} degré, au contraire, le régime d'été règne pendant tout le mois sans aucune perturbation notable. Le maximum des Açores, bien développé, s'étend par le centre de la France jusqu'en Suisse, se reliant avec

un autre maximum relatif sur la Méditerranée, tandis que les trois minima normaux de la haute vallée du Pô, de l'Espagne et de l'Algérie correspondent aux maxima de la température. Dans cette région méridionale, la pluie est presque partout nulle ou inférieure à 25^{mm} et ne s'est produite que sous l'influence d'orages, accompagnés de faibles mouvements du baromètre.

Septembre.

De même que nous avons vu la saison chaude débuter tardivement dans le Sud en 1879, nous la voyons encore se terminer beaucoup plus tôt que de coutume. En septembre 1878, la distribution générale de la température rappelait exactement celle des mois de juillet et d'août, avec maximum fermé sur l'Espagne. En 1879, au contraire, ce caractère a disparu : l'excès de température de la péninsule ibérique sur les mers voisines devient faible à l'Ouest, et nul même par rapport à la Méditerranée; il semblerait que l'hiver si remarquable de 1879-1880 s'annonce déjà par un abaissement considérable de température sur l'Espagne.

En France, le mois de septembre offre une température analogue à celle de l'année précédente; sur les îles Britanniques elle est plus basse et encore inférieure à la normale, mais notablement moins que dans les mois précédents.

Ces caractères sont en rapport avec les mouvements de l'atmosphère, qui ont offert en septembre 1879 des particularités intéressantes : les dépressions ont été moins nombreuses sur les îles Britanniques et la mer du Nord que pendant les mois précédents, bien qu'on en signale encore quelques-unes de très profondes, notamment celle du 23, qui fit descendre le baromètre, à Stornoway, au-dessous de 725^{mm}. Mais, en revanche, de nombreuses dépressions secondaires ont apparu sur la Méditerranée, se formant sur place ou venant de l'Ouest, et amenant sur l'Espagne de très fortes pluies et la distribution anomale des températures que nous signalions plus haut.

Il faut encore indiquer pendant ce mois un autre fait qui, bien que se manifestant en dehors des limites de notre Carte, n'en a pas moins une grande importance, comme on le verra par l'étude du mois suivant : c'est l'établissement, au nord-est de l'Europe, d'une aire permanente de hautes pressions, qui, formée dès le 7 en Russie, a oscillé pendant tout le reste du mois de la Russie à la Scandinavie, mais sans jamais disparaître.

Sous l'influence des dépressions dont nous avons parlé, les pluies ont été très abondantes dans l'ouest de l'Écosse et en Irlande d'une part, de l'autre dans le sud de la France et le nord de l'Espagne et de l'Italie. Les dépressions méditerranéennes ont également amené beaucoup plus de pluie que de coutume en Algérie, principalement dans la Kabylie et l'est de la province de Constantine.

Octobre.

Avec le mois d'octobre se produit définitivement le changement de régime qui a commencé l'hiver exceptionnel de 1879-1880. Le maximum de pression qui existait le 1er en Russie descend le 2 sur l'Europe centrale et persiste pendant tout le mois en se portant vers l'Irlande et l'Océan du 7 au 16, vers la France et l'Espagne du 17 au 25, pour remonter ensuite vers l'Est et s'étendre de nouveau le 31 de la Russie aux îles Britanniques. Sur la Carte de la pression moyenne, un grand maximum couvre l'Atlantique, des États-Unis au nord des îles Britanniques, amenant sur l'Europe centrale des vents dominants de l'Ouest qui s'infléchissent au Nord sur la France et l'Italie.

La présence de cette aire de hautes pressions sur l'ouest de l'Europe refoule les dépressions soit vers le Nord et la Russie, soit dans le Sud, sur la Méditerranée. Les bourrasques ont été du reste peu nombreuses, et les seules baisses importantes du baromètre en France sont celles du 20 et du 25, auxquelles il convient d'ajouter, pour la région méditerranéenne, celle du 16, qui ne s'est du reste pas fait sentir d'une manière appréciable au-dessus de la France centrale.

Ce changement complet de régime se manifeste également dans la Carte des pluies. A l'inverse des mois précédents, le temps se met au sec en Angleterre, où l'on remarque même à l'Est toute une longue bande où la pluie totale n'atteint pas 25^{mm}. De même, la pluie est relativement faible dans toute l'Europe centrale et en France.

Dans notre pays en effet, au nord du plateau central, c'est-à-dire dans l'Est, la vallée de la Saône et les bassins de la Seine et de la Loire, il n'a plu d'une manière appréciable que du 16 au 21, sous l'influence de la bourrasque du 21, qui a refoulé loin dans le Sud le maximum barométrique. Dans la région méditerranéenne, au contraire, la pluie est tombée surtout dans les derniers jours du mois, alors que les hautes pressions s'étendaient de la Russie aux îles Britanniques et que les basses pressions se montraient sur l'Espagne, amenant ainsi des vents d'Est en Provence et dans le Languedoc.

Les manifestations électriques ont été extrêmement rares en France en octobre, ce qui est bien d'accord en effet avec la distribution générale des pressions. A Paris, en particulier, on n'a même pas aperçu une seule fois des éclairs. Notons encore que les gelées ont commencé pendant ce mois, ce qui, du reste, n'a rien d'anomal : il a gelé une seule fois à Paris, dans la nuit du 16 au 17, et le thermomètre est descendu à $-1°,9$.

Novembre.

Le mois de novembre voit s'accentuer d'une manière remarquable les caractères du mois précédent. Tandis que la pression descend beaucoup sur l'Atlantique

(759^{mm} en moyenne aux Açores et 758^{mm} à Madère), le baromètre se tient très élevé à l'ouest des îles Britanniques; sur l'Irlande entière, la pression moyenne est supérieure à 770^{mm}. Il y a donc là une sorte de renversement complet dans la loi de distribution des pressions.

Pendant le mois de novembre, en effet, l'aire de hautes pressions que nous avons vue sur tout le nord de l'Europe à la fin du mois précédent continue à se montrer en oscillant de l'Ouest à l'Est, mais sans jamais disparaître. Jusqu'au 8 elle est située à l'ouest des îles Britanniques, et le baromètre dépasse même 780^{mm} le 6 à Valentia ; le 8 et le 9, elle descend par la France vers l'Europe centrale ; puis, entamée un instant par une dépression qui se montre le 12 sur la mer du Nord, on la voit se reformer le 14 sur le golfe de Gascogne. Elle se rejoint le 19 à une seconde aire de fortes pressions qui arrive de Russie, et depuis cette époque le maximum de pression oscille dans le nord de l'Europe, d'abord sur la Russie, puis sur la Scandinavie et enfin à l'ouest des îles Britanniques, où il existe encore, quoique moins apparent, dans les derniers jours du mois. Pendant ce temps, les dépressions ont généralement été repoussées en dehors de la région que nous considérons. Il y a lieu toutefois de signaler celle du 12, apparue sur la mer du Nord, et qui a fait descendre à Paris le baromètre seulement à 760^{mm}, et surtout celle qui a traversé l'Espagne et le golfe du Lion du 28 au 30, amenant le baromètre à 747^{mm} dans la matinée du 28, sur le golfe de Gascogne, et à Marseille le 30 vers 1^{h} du soir. L'origine océanienne de cette dépression semble à peu près certaine, car le baromètre s'était abaissé à 746^{mm} le 26 à Funchal.

La direction dominante des vents est le Nord avec légère inclinaison à l'Ouest sur les îles Britanniques, la France, les Pays-Bas, le Danemark et une partie de l'Allemagne. En Espagne, au contraire, comme les basses pressions relatives sont à l'Ouest, du côté de Madère et des Açores, le vent est d'entre Nord-Est et Sud-Est. Aussi la Carte des températures moyennes accuse-t-elle nettement tous les caractères d'une Carte d'hiver; les isothermes s'infléchissent brusquement vers le Sud, en arrivant de l'Océan sur les côtes occidentales de l'Europe, tellement que l'isotherme de 6° passe successivement par le nord de l'Écosse, la Bretagne, le sud de la France, la vallée du Pô et Venise.

La température, normale en Écosse et en Irlande, tombe en dessous de la moyenne en Angleterre, où se montre un minimum fermé de 4°, en Danemark, dans l'Allemagne centrale, les Pays-Bas et la France. Dans notre pays, en particulier, le froid est grand : à Paris, on ne compte pas moins de 12 jours de gelée, dont 5 consécutifs, du 26 au 30, avec un jour de gelée totale (le 27, maximum $-2°,9$), et un minimum absolu de $-6°,7$ le 29.

Comme on pouvait s'y attendre par les caractères précédents, le mois de novembre est un mois sec. La pluie est faible dans les îles Britanniques, la France et toute l'Europe centrale. On remarque même toute une grande région, com-

prenant le sud de l'Angleterre et la France jusqu'à la Loire, où la quantité d'eau recueillie est inférieure à 25^{mm}. La pluie augmente, au contraire, vers l'Espagne et l'Italie, où elle s'est produite dans la seconde partie du mois sous l'influence des dépressions de la Méditerranée.

Décembre.

Le mois de décembre débute par une situation très troublée : le 1er et le 2, le baromètre est en bas sur toute l'Europe, et il existait déjà le 2, au large, du côté des Açores, une importante dépression barométrique ; cette dépression se propage vers le Nord-Est ; elle arrive le 3 décembre au matin au large de la pointe d'Espagne (la Corogne, Porto, 737^{mm}), passe par Paris dans la nuit du 4 au 5 (minimum à Paris, 736^{mm},9 le 5 à 2^{h} du matin) et se comble enfin le 6 sur l'Europe centrale. En même temps, les hautes pressions reparaissent simultanément le 6 sur le golfe de Gascogne et la Finlande, et se réunissent le 7 sur l'Europe centrale, où elles règnent jusqu'à la fin du mois, amenant des pressions fréquemment supérieures à 780^{mm} et quelquefois même à 785^{mm}. Une bourrasque qui passe dans le nord de l'Écosse et la Scandinavie, du 27 au 31, refoule un peu les hautes pressions vers le Sud ; mais on les retrouve encore sur l'Espagne et la Méditerranée jusqu'au dernier jour du mois.

La Carte des pressions moyennes de décembre montre ainsi une aire de hautes pressions qui couvre toute l'Europe centrale et dont le centre (774^{mm}) s'étend sur la Suisse et le Tyrol. Au nord de l'Écosse la pression est encore de 763^{mm}, et sur la Méditerranée, où existe un minimum relatif, le baromètre tombe à peine au-dessous de 766^{mm}. Vers l'Est la pression diminue, ce qui montre que le maximum de l'Europe centrale n'est pas, comme on pourrait le croire, une simple extension du maximum sibérien de l'hiver, mais un deuxième maximum tout à fait distinct de celui de l'Asie. Celui-ci est en effet très peu développé (Irkoutsk, 770^{mm} environ) et est séparé du maximum de l'Europe par un grand minimum relatif (Moscou, 762^{mm} ; Saint-Pétersbourg, 760^{mm} ; Kasan, 758^{mm} ; Iekaterinbourg, 756^{mm} ; Archangelsk, 753^{mm}) ; ce minimum relatif montre le chemin suivi par les dépressions, dont aucune, dès le 6 décembre, n'a atteint l'Europe centrale, toutes passant par le nord de la Scandinavie.

Tout autour du maximum de pression de l'Europe centrale, le vent diverge en coupant à peu près les isobares à angle droit, caractère qui semble général sur les continents, autour des aires de hautes pressions, et toutes les fois que la vitesse de l'air est faible.

Un fait plus remarquable encore que la distribution des pressions est celle des températures. Un minimum développé d'une manière extraordinaire occupe toute l'Europe centrale, et la température moyenne du mois s'abaisse jusqu'à — 11°

dans la Bavière et une partie de l'Autriche. A l'est de ce minimum, la température va d'abord en augmentant : la moyenne est, en effet, de — 5°, 9 seulement à Vilna, de — 6°, 8 à Saint-Pétersbourg, de — 7°, 7 à Varsovie et Pinsk, de — 7°, 9 à Kieff, etc.

Il y a donc eu, sur toute l'Europe centrale et occidentale, un minimum distinct de température coïncidant avec le maximum de pression. On conçoit, du reste, qu'il y ait une dépendance étroite entre ces deux phénomènes : l'abaissement de température ayant pour conséquence une contraction, et par suite un afflux d'air venant des hautes régions de l'atmosphère, air qui augmente la pression au-dessus du minimum de température et produit un écoulement lent à la surface du sol vers l'extérieur, à partir des points où la pression est le plus haute.

Comme nous l'avons déjà indiqué dans l'étude du mois de février 1878, où il existait sur l'Europe centrale un maximum de pression analogue, quoique dans des conditions moins exceptionnelles, cette distribution de la pression et de la température a pour conséquences un temps sec et une nébulosité très faible. En effet, le mouvement descendant au-dessus du centre de hautes pressions y amène sans cesse de l'air venant des hautes régions de l'atmosphère, c'est-à-dire contenant extrêmement peu de vapeur d'eau. Aussi la pluie est nulle en France du 7 au 30; à Paris, la nébulosité moyenne est inférieure à 5, ce qui donne pour décembre le minimum de nébulosité de toute l'année, et même des quinze mois qui précèdent, jusqu'en septembre 1878.

Une autre conséquence de ce régime sur laquelle l'attention a été vivement excitée, bien que ce phénomène soit, en somme, assez fréquent, est une inversion de température dans la verticale. Ce phénomène a été tellement marqué, que la température moyenne du sommet du Puy-de-Dôme a été, en décembre 1879, de — 3°,9 ; celle de Clermont-Ferrand, à 1080^{m} plus bas, s'abaissant à — 7°,0. Pour mieux se rendre compte de cette inversion, il faudrait réduire les deux températures au même niveau; or la différence de 1080^{m} correspond normalement, en hiver, à un abaissement de 5°,4 dans la température. Si la décroissance de température avait été normale, on aurait donc obtenu au Puy-de-Dôme une moyenne plus basse de 5°,4 que celle de Clermont, soit — 12°,4, au lieu de — 3°,9 que l'on a réellement observé, ce qui constitue un excès de 8°,5. Pour certains jours en particulier, la différence est bien plus grande encore ; le 21, par exemple, le minimum est de — 13°,7 à Clermont et de + 3°,2 au sommet, soit une différence brute de 16°,9 et corrigée de 22°,3.

Cette inversion se comprend aisément : en effet, quand l'air est pur et sec, son pouvoir diathermane est grand et son pouvoir absorbant à peu près nul; le rayonnement énergique du sol abaissse donc considérablement, par contact, la température des couches les plus basses de l'atmosphère, tandis que les couches supérieures n'offrent qu'une variation insignifiante ou même complètement

nulle. L'inversion se produira donc très vite et se maintiendra facilement, surtout en hiver, où l'échauffement diurne est inférieur au refroidissement nocturne et où, par suite, la température superficielle s'abaisse de plus en plus. Comme l'inversion signalée se produit assez souvent, même pendant les nuits claires de l'été, il n'y a rien d'extraordinaire à ce qu'elle persiste en hiver, où les conditions sont beaucoup plus favorables, et qu'elle atteigne une valeur remarquable quand le ciel est pur, ce qui a été fréquent en décembre; en particulier, pendant toutes les journées du 19, 20 et 21, le ciel a été entièrement découvert à la base et au sommet du Puy-de-Dôme, ce qui rend compte de la différence de 16°,9 (22°,3 corrigée) observée entre les deux stations, le 21, après ces trois jours consécutifs de beau temps.

Du reste, une inversion due à cette cause ne peut se manifester que dans les couches les plus voisines du sol. A une certaine altitude, le phénomène normal de la décroissance commence à prévaloir de nouveau, comme l'expérience l'a montré même en décembre 1879. Au Pic du Midi, en effet, malgré une position plus méridionale et une plus grande proximité de la mer, la température moyenne du mois s'abaisse déjà à $-5°,6$ pour une altitude de 2366^m, soit $1°,7$ de moins qu'au Puy-de-Dôme. On peut évaluer à 2° ou 3° au moins la différence de température que doivent présenter deux points situés à la même altitude dans les régions du Puy-de-Dôme et du pic du Midi, car la différence dans les moyennes annuelles est précisément de 2°, et elle doit s'accentuer en hiver. L'excès réel de $1°,7$ du Puy-de-Dôme sur le Pic du Midi correspondrait donc à une différence comprise entre 4° et 5°, pour des conditions géographiques qui seraient identiques. Or la décroissance normale, en hiver, pour deux stations dont l'altitude diffère de 900^m, comme dans le cas actuel, est précisément de $4°,5$. On voit donc qu'à partir du niveau du Puy-de-Dôme, et peut-être même plus bas encore, l'inversion avait complètement disparu, et qu'on était revenu dans les conditions ordinaires. Ainsi l'inversion constatée en décembre était due simplement au refroidissement des couches inférieures de l'atmosphère par contact avec le sol.

Remarquons, de plus, que l'état atmosphérique que nous venons de décrire est extrêmement stable, la densité de l'air décroissant très rapidement avec la hauteur, grâce à la fois à la diminution de la pression et à l'augmentation de la température; et, comme cette dernière cause de stabilité augmente d'importance à mesure que l'état général dure lui-même depuis plus de temps, c'est-à-dire que le refroidissement du sol est plus grand, ce régime peut persister très longtemps. Une autre condition extrêmement favorable se trouvait enfin réunie, en décembre 1879, à toutes les autres : la grande quantité de neige qui recouvrait partout le sol depuis la bourrasque du 4. En effet, le pouvoir émissif de la neige est beaucoup plus grand que celui du sol, ce qui augmente

encore le rayonnement, et, par suite, le refroidissement des couches inférieures de l'atmosphère.

On voit donc que le phénomène de basses températures localisées dans les couches inférieures de l'atmosphère ne présente rien qui ne puisse être prévu par les considérations ordinaires.

Il n'est pas moins intéressant de chercher à se rendre compte des circonstances qui ont accompagné le changement momentané d'un tel régime à partir du 28 décembre. Ces circonstances se sont manifestées dès le 27. Une bourrasque importante se présente en effet, le matin du 27, au nord-est de l'Écosse, amenant, sur les îles Britanniques et les côtes de Norvège, des vents très violents de la région Sud. L'appel d'air déterminé par cette bourrasque gagne les côtes françaises de la Manche le 28. D'autre part, le sens de la circulation atmosphérique se renverse aussi dans les couches plus élevées : au Puy-de-Dôme, le vent, qui avait soufflé de la direction Est depuis le 7, tourne et passe à l'Ouest et au Sud-Ouest dans la nuit du 27 au 28. L'écoulement d'air qui se produit ainsi en France, vers le Nord, augmentant rapidement, la pression diminue, la baisse du baromètre devient sensible à Paris dans la journée du 28 et le vent prend de la force. La première condition des grands froids, le calme de l'air, disparaît, et, comme en même temps le vent incline à l'Ouest, par suite du déplacement de la bourrasque vers la Norvège, la température monte rapidement. L'air chaud et humide de l'Océan, arrivant sur les terres refroidies et couvertes de neige, donne naissance à quelques pluies qui favorisent encore le relèvement de la température; aussi, tandis que le thermomètre marquait encore $-15°,1$ à minuit dans la nuit du 27 au 28, il arrive à 0° douze heures après et marque $+3°,0$ à minuit le 28-29. En même temps, les isobares s'orientent Est-Ouest et le vent se fixe entre le Sud et l'Ouest, ramenant ainsi sur nos régions le temps humide et les températures douces qui caractérisent dans nos pays le régime des vents océaniens. Bien que l'Europe occidentale n'ait pas été directement sur le passage de la bourrasque du 27, c'est donc dans cette dernière qu'il nous semble que l'on doive rechercher la cause immédiate du changement brusque de régime qui s'est effectué ainsi dans la journée du 28.

Tels sont les traits principaux qui ont caractérisé le mois de décembre 1879 et en ont fait, pour la France et l'Europe centrale, un mois tout à fait exceptionnel, tel qu'il faut remonter jusqu'à l'hiver historique de 1789 pour retrouver des températures aussi basses.

A Paris il a gelé sans interruption les vingt-huit premiers jours du mois, ce qui, en ajoutant les cinq derniers jours de novembre, donne trente-trois jours de gelée consécutifs, parmi lesquels il y en a eu vingt-sept où le thermomètre est resté constamment au-dessous de zéro. La plus basse moyenne diurne est celle du 9 ($-18°,7$), et le minimum absolu, relevé sur le thermomètre à mercure, a

été de — 25°,6 le 10 à 1^{h} du matin. On signale des minima plus bas encore : — 27° à Commercy, — 27°,6 à Melun, — 28° à Senlis, — 29° à Jonchery (Marne), et même jusqu'à — 30° dans certains points du département des Vosges.

L'influence de la mer s'est du reste fait sentir, comme toujours en hiver, mais à une très petite distance des côtes seulement, ce qui tient à ce que le vent était presque partout dirigé de la terre vers la mer. Aussi le resserrement des isobares tout le long des côtes de France, sur la Carte moyenne de décembre (Carte n° 24), loin d'avoir été exagéré dans le dessin, est plutôt trop faible encore, comme le montrent les observations faites au large sur le feu flottant de Rochebonne qui donnent pour le mois entier une moyenne de + 5°, 5. En certains jours même, la variation de température dans le voisinage des côtes a présenté une rapidité bien plus grande encore : le 9 au matin, par exemple, tandis que le minimum atteignait — 24°, 2 à Paris et était encore de — 15°, 9 à Rouen, le thermomètre ne s'abaissait même pas tout à fait à 0° au cap de la Hève, soit une différence de 16° pour une distance de 70^{km}.

On retrouve en outre, sur la Carte moyenne, l'influence de l'altitude, qui se révèle sur le Morvan par une courbe fermée de — 6°, maximum relatif par rapport aux régions voisines. Quelques sommets isolés, tels que le Puy-de-Dôme, donneraient des maxima relatifs bien plus remarquables encore, mais qui sont trop restreints en surface pour pouvoir figurer à l'échelle de la Carte. C'est encore à l'inversion des températures dans la verticale que l'on doit rapporter le maximum du massif des Alpes, que contourne entièrement l'isotherme de 0°. En réalité, la température était inférieure à 0° dans les stations alpestres, mais assez peu pour que la réduction de la température au niveau de la mer ait relevé le nombre corrigé au-dessus de 0°. On remarquera enfin, sur la même Carte, le minimum qu'offre la vallée du Pô, minimum normal en hiver, comme nous l'avons déjà indiqué dans la Revue de 1878, mais qui s'est exagéré encore sous l'influence du régime exceptionnel de décembre.

Dans les îles Britanniques, qui se trouvaient à peu près à la limite des hautes pressions, la température moyenne est basse, mais non exceptionnelle. Elle est généralement un peu plus élevée, en effet, qu'en janvier 1879 pour l'Angleterre même, et plus élevée partout en Écosse et en Irlande. Les minima absolus sont cependant plus bas dans un certain nombre de points, surtout dans le sud-est de l'Angleterre, où le thermomètre serait descendu exceptionnellement et dans une station seulement (Audley-End), à — 20°, 8 (?). Notons que les minima absolus dans l'est de l'Angleterre sont tous signalés à la date du 7, c'est-à-dire beaucoup plus tôt que sur le continent et au moment même du passage de la bourrasque qui a précédé la grande période de froid.

Résumé de l'année 1879.

Comme l'année précédente, les Cartes annuelles comprennent la pression et la température moyennes, la hauteur et le nombre de jours de pluie.

La Carte de la pression moyenne de 1879 diffère peu de celle de 1878, malgré les oppositions que présentent un grand nombre des mois correspondants des deux années. En France, la pression moyenne est presque partout supérieure à 762^{mm} et va en diminuant vers le Nord, un peu moins rapidement qu'en 1878.

La température est partout, sans exception, plus basse en 1879 que l'année précédente; la différence dépasse même 2° dans un certain nombre de stations. Cet abaissement se comprend aisément, car l'année 1879, indépendamment même du mois de décembre, a été pendant presque toute sa durée une année froide. Du reste, la disposition générale des isothermes est bien la même dans les deux années, abstraction faite de la valeur absolue des températures.

Enfin les deux autres Cartes, hauteur totale de pluie et nombre de jours de pluie, s'écartent davantage de celles de 1878. La quantité de pluie est généralement moindre en 1879 dans les îles Britanniques, les Pays-Bas et le nord de l'Espagne, et le nombre de jours de pluie y est plus faible; en Algérie, au contraire, et dans le sud de l'Espagne, il y a un excès sur 1878, aussi bien comme quantité de pluie que comme fréquence. La comparaison est du reste assez difficile entre les deux Cartes des nombres de jours de pluie, car la Carte de 1879, établie avec beaucoup plus de documents, renferme plus de détails et comprend notamment l'Allemagne, qu'on avait dû laisser presque entièrement de côté en 1878.

Janvier 1879.
